English (Professional — TOEIC 980/990)

SUMMARY

Backend-focused software engineer designing reliable, maintainable systems through rigorous automated testing and declarative infrastructure. Experienced in Java Spring Boot, Rust, and full-stack delivery. Available for a 3-month software engineering internship in Europe or the US, starting June 2027.

EXPERIENCE

Software Engineer (Apprentice) — Numih France (DOGRH) Sep 2025 – Present

- Architected and maintain a unified E2E test engine (Java Spring Boot, Selenium) running 50–70 automated integration tests, executable identically via Maven in CI or an async REST API.
- Refactored the test architecture to cut the false-positive rate by ~70% and reduce environment/version migrations from ~4 hours to under 10 minutes.
- Built developer tooling and data-isolation abstractions (Jenkins) to interact easily with in-house applications and eliminate concurrent test collisions.
- Developed and deployed a Spring Boot internal tool that auto-distributes daily product-support duties across ~40 developers.

Fullstack Developer Intern — Ekeep-IT Apr 2025 – Jun 2025

- Engineered RESTful backend services (Java Spring Boot, relational database) powering My-UUU, an equestrian-facility directory and review platform.
- Developed responsive interfaces in Next.js (React) and shipped sprint user stories in an Agile/Scrum team for a production-facing product.

SELECTED PROJECTS

min-btc-node GitHub

Wrote a Rust tool that tracks a Bitcoin address's balance and transaction history by hand-implementing the P2P wire protocol, fetching block headers from multiple peers in parallel without full-chain validation.

Rust · Bitcoin · Networking

nixos-config GitHub · Deep dive

Declared 6-host NixOS configurations and dotfiles (Nix flakes + Home Manager) — a self-hosted server exposing personal services, a backup Raspberry Pi, desktops, a laptop and a Steam-OS-style console — all versioned and reproducible as IaC.

Nix · NixOS · Linux · IaC

pixel-war GitHub

Course project — designed a Web3 pixel-canvas dApp in Solidity, exploring on-chain state, pull-over-push refunds to prevent reentrancy, and ERC-721 snapshot minting.

Web3 · Solidity · JavaScript · Blockchain

RayTracer-Rust GitHub

CPU ray tracer in Rust with Bounding Volume Hierarchy (BVH) spatial partitioning for O(log N) ray-primitive intersections, Phong shading, and reflections.

Rust · Graphics · Ray Tracing · BVH

QGChat GitHub

Full-stack chat app in Java EE with Docker Compose deployment, SQL persistence, and a JavaScript frontend.

Java · Java EE · Docker · WebSocket · SQL

ascii-cube-rs GitHub

Real-time ASCII 3D cube renderer compiled to WebAssembly via a Nix flake — powers the hero widget on this portfolio.

Rust · WebAssembly · Nix

SKILLS

Languages & Systems:
Rust · Java · C · Python · TypeScript · JavaScript · WebAssembly

Backend & Web:
Spring Boot · Java EE · React · Next.js · Node.js · Angular

DevOps & Infrastructure:
NixOS · Linux · Docker · Podman · Jenkins · Traefik · Git

Architecture & Quality:
Selenium · JUnit 5 · Design Patterns · Agile

EDUCATION

Master of Engineering — Software Engineering Sep 2025 – Present
IMT Nord Europe, Institut Mines-Télécom

Bachelor of Science — Computer Science Sep 2023 – Jun 2025
University Institute of Technology of Lille — Graduated top of the class

LANGUAGES & INTERESTS

Languages: French (Native) · Spanish (Intermediate)

Interests: Sport shooting · Triathlon training · Weightlifting
